   Infective Esophagitis .............. 60
   Esophagitis Due to Candida albicans (Monilial Esophagitis) .............. 60
Acknowledgements

When a book is written in the setting of a routine diagnostic department of a major teaching hospital it owes its content inevitably to a vast number of people who cannot possibly be identified, let alone named, individually. Accordingly I must simply acknowledge my debt to my many clinical colleagues who, over the past twenty years or more, have referred their patients for investigation or sent specimens for interpretation. I am particularly grateful for the opportunities I have had for clinico-pathological discussions and for the readiness with which follow-up information has been provided.

To my fellow pathologists I also express my appreciation. Many have contributed to the assessment of the diagnostic material and again it is difficult to itemise specifically the many occasions on which discussion with colleagues has yielded information and ideas that are incorporated in this book. I am particularly indebted to Dr. Gabriele Medley for her many comments on various aspects and, specifically, for her assistance with the section on malignant lymphomas and I am also indebted to Dr. Peter Wallis for details of some of the unusual esophageal neoplasms. The assistance received from Professor Bhathal, Dr. Essex and Dr. Tang of Victoria, Dr. Waters and Dr. Armstrong of Western Australia and Dr. Leiman and Dr. Berry of South Africa is acknowledged in the appropriate areas of the text and I am most appreciative of this assistance. Dr. Elaine Waters of Western Australia was, as always, particularly generous in making available her case material.

I am most grateful to Dr. Shirley Roberts, Director of Radiology, Prince Henry's Hospital, who provided me with the X-rays that are reproduced throughout this work. Dr. Roberts and her colleague, Dr. Margaret Kinnaird, gave generously of their time in the explanation of this radiological material. Dr. Wayne Hancock, Research Scientist, Department of Nephrology, Prince Henry's Hospital, provided material and advice on the immuno-histological techniques discussed in Chapter 5.

Acknowledgements X

In every cytology department the contribution of the cytotechnologists is a major one. Again it would be difficult to name individually the many people who, over the years, have contributed to the evaluation of our material. However, Miss Megan Doran has made a major contribution to this evaluation by her skill and dedication to the techniques of gastro-esophageal cytology.

The secretarial work associated with a production of this sort is tedious and time-consuming. I thank my former Secretary Miss Betty Blomfield
who initiated this work and I am deeply grateful to my present Secretary, Mrs. Carole Kirsten, who so ably completed the various drafts and the final manuscript and assisted so competently with the organization of the material. Finally it is my pleasure to acknowledge the enormous contribution made by my colleague Miss Patricia Archer. Many of the concepts embodied in this text have resulted from our discussions and our evaluation, in collaboration, of cytological material over the past twenty years. Miss Archer is personally responsible for many of the illustrations and made a major contribution to the organization of the materials used in the compilation of this book. I am most grateful to her.

Michael Drake
This book is dedicated to
John F. Funder
with respect and affection to my teacher, friend and former colleague.
