Murphy's Law says that if you design an instrument so simple that even idiots can use it, then only idiots will use it. That may be funny, but it is false. Designing complicated instruments for assessment is useless if you lose the underlying aim, because as Kant said, 'theory without practice is empty.' On the other hand, if you design a simple, useful instrument which has sophisticated thinking behind it, then it may work, but 'practice without theory is blind.' I thank you all for contributing to today's discussions.
