ACKNOWLEDGEMENTS

I should like first to acknowledge my great indebtedness to Professor Olavi Eranko, M.D., Ph.D., my chief in the Department of Anatomy, University of Helsinki, under whose guidance the present investigation was carried out. He has generously imparted to me his extensive knowledge of biochemistry and biophysics and his great technical skill and experience in the use of different microscopic methods. Without his neverfailing readiness to advice me in various problems turning up in the course of this work and his valuable criticism during the preparation of the manuscript this study could not have been carried out. To him I offer my deeply felt thanks.

To Docent Martti J. Karvonen, M.D., Ph.D., my former chief in the Department of Physiology, Institute of Occupational Health, Helsinki, I am very much indebted for many valuable discussions and for his interest in my work. Moreover, he has placed the laboratory facilities of his department at my disposal, for which my most sincere thanks are due to him.

Professor William Kerppola, M.D., the chief of the 1st Medical Clinic, and Professor Ilmari Vartiainen, M.D., the chief of the 1Ind Medical Clinic, University of Helsinki, have kindly permitted me to study the blood of patients treated in their clinics, for which I thank them very much.

I am very grateful to Mr. Jeddi Hasan, M.B., who has helped me in translating this report into English. Mr. Jaakko Kihlborg, M.A., has advised me in the use of statistical calculations, for which my thanks are due to him. To my colleague, Dr. Pekka Virtama, M.D., who has been working on related problems, I wish to express my appreciation for his valuable aid in many phases of the work. I should also like to thank Mrs. Jean M. Pertunen, B.Sc, for correcting the English text.

Finally, I owe a great debt of gratitude to my wife for her constant patience and help in the course of the study.

Helsinki, July 1958
