The Settling of Sludge During Life

First Observations, Evidences, and Significances. A Contribution to the Biophysics of Disease

M.H. Melvin H. Knisely

Department of Anatomy, Medical College of South Carolina, Charleston, South Carolina U.S.A.

The studies on which this paper is based were made possible through support given by the Tennessee Valley Authority through the Division of Preventive Medicine of the University of Tennessee.

The work was aided by: a grant from the Ella Sachs Plotz Fund; a grant from the Dr. Wallace O. and Clara A. Abbott Memorial Fund of the University of Chicago; United States Navy Contract NONR: 441; and by United States Public Health Service Grant H-4176.

Bibliography of Sludged Blood

Intravascular agglutination, or aggregation, of the blood cells to a circulating sludge has been observed by many different investigators. Because we now believe that the intravascular
agglutination of blood cells directly damages the patient, we are attempting to maintain as complete a bibliography as possible of those papers dealing with blood sludge and closely related phenomena. Our accumulated bibliography to date appears at the end of this article under the title “Sludge Bibliography”. As such a bibliography can never be complete, we beg your indulgence for papers missed, and beg the reader to send us references which we do not have. If this is done, then in future years it may be possible to publish more complete bibliographies on sludged blood.

Acknowledgments
It is a privilege to express appreciation for the following assistance. To the late Professor August Krogh of the University of Copenhagen, and to Professor R. N. Danielson of the Department of Physiology, Medical College of South Carolina for translating Professor Fåhraeus’ Swedish articles into English. To Professor R. N. Danielson and Hilda Debacker for the careful translations of a series of German articles which are now available to persons interested in this field. To Dr. T. G. Darby, Department of Pharmacology, Medical College of South Carolina, who called to our attention that the variations in “g” values experienced by aviators may be a determinant in the precipitation of masses from their circulating blood. To Grace Miller and Marie Rose Newton for making the drawings. To Sarah Toomey, Virginia Hill, Frances Higginbotham, Hilda Debacker and Dorothy Huff for the collection of the bibliographies. This work could not have been done without the assistance described above.
