Controversy in Nephrology

In this issue of Nephron we publish two editorials which give conflicting points of view on the existence of uraemic cardiomyopathy. We do this deliberately, partly to give a true picture of the state of the art, and partly to give life to the pages of this scientific journal. We therefore invited Drs. Prosser and Parsons of Westminster and Kings College Medical Schools of the University of London to put forward their views which were aired at the recent highly successful First International Congress on Intensive Care at Imperial College, London (June, 1974), informing them at the time that we intended to put forward the contrary view on the existence of uraemic cardiomyopathy. We welcome the views of our fellow Nephrologists and Cardiologists on this controversial matter.

Professor G. M. Berlyne and Professor S. Giovannetti
