A. Yannitsiotis, 51 Homirou Street, Athens (Greece)

150 multitransfused patients (119 haemophilia A, 24 haemophilia B, 7 von Willebrand's disease) underwent a follow-up concerning liver functioning abilities to withstand multiple transfusions.

Our findings can be summarized as follows: normal liver function was found in 28.6% of our series, improvement to normal in 22.6%, notable improvement towards normal in 8% and a definite impairment in
