Plate I

Fig. 7. Intraocular endoscopic monitor photographs of the anterior portion of the major ciliary processes and iridial ciliary processes in the albino rabbit, a Control specimen (× 27): arrowheads = venules of the iridial processes; arrows = venules of the anterior edge of the major ciliary processes, circle ≈ region observed in figure 7b and c. b, c (× 75): blue interference filter added to the light source to show FITC fluorescence; (b) before IOP reduction, 1 min after intravenous injection of FITC-dextran; (c) 8 min after IOP reduction a leakage of FITC-dextran is found around the iridial ciliary processes (arrows).

Plate I
Fig. 4. Cannulation of one of the superior vortex veins with a 30-gauze needle attached to fine Silastic tubing and stabilized with 7-0 silk ties. Blood is seen in the lumen of the tubing, a. The superior rectus muscle is shown grasped with fixation forceps and the globe is shown rotated inferiorly. b Close-up of figure 4a revealing the lumen of the tubing (filled with red blood) to be approximately 0.3 mm in diameter. This equates with the size of the 30-gauge needle and the size of the vortex vein. Although it is called a vortex vein, it is actually a venule since it is less than 1 mm in diameter.
