Possibilities of Clinical Photography in Otorhinolaryngology

H.J.B.J.		Lubbebs
----------	--	---------

Summary.

Medical photography can be a useful help for the otologist.

Due to the fact that most cavities only can be observed with one eye, it is impossible to discuss with others facts that have been observed. Whenever a photogram can be taken under the same angle as the observer sees the object, one has always a document at hand. Especially for bronchoscopy in a team the photo has a great value for the whole team. One can discuss the case without the patient. Whenever the X-photos can be copied and the slides from the pathologist with the typical points have been photographed in colour, one has a total document from the patient.

Demonstration of 5 patients with slides from X-photos, broncho-grams bronchoscopic and microscopic coloured photos.
