Nasopharyngeal Fibro-angioma

H.		Jongert
----	--	---------

From the E.N.T. Clinic of the University Hospital, Groningen

A microscopical examination of 28 cases. Special attention was paid to the blood vessels. 4 different types of vessels are found: 1. arteries of normal structure; 2. thick-walled vessels without elastin and muscular fibres; 3. thin-walled vessels with only a distinct endothelial membrane, and 4. capillaries with swollen endothelial cells.

Instead of calling these tumours fibroma, we suggest, with some other authors, the name of fibro-angioma.
