David G. McLone

Chicago, Ill., USA

Chiari II

This is an MRI of a young teenage woman with average intelligence, hydrocephalus, and minimal hindbrain signs or symptoms. The MRI sequence shows the large massa intermedia, an elongated rather than peaked quadrigeminal plate that extends to the level of the foramen magnum.

The cerebellum is almost entirely in the cervical spinal canal.

Amazingly the inferior surface of the occipital pole of the cerebrum is below the foramen magnum and the choroid plexus extends nearly to the level of T1.
