Ten Years Keratocele

G.M.

Smith

Santpoort

Abstract

Description of the pathologic-anatomic findings of a cornea obtained by keratoplasty from a 78-year-old woman who had sustained a keratitis parenchymatosa luetica in her youth. Pre-operatively there was a corneal ulcer with descemeto-cele formation and threatening perforation. Descemet's membrane was extremely thickened. The mechanism of development of this membrane is discussed.
