Optical Coherence Tomography
Optical Coherence Tomography

Volume Editors

Gabriel Coscas  Crêteil/Paris
Anat Loewenstein  Tel Aviv
Francesco Bandello  Milan

137 figures, 97 in color, and 9 tables, 2014
Contents

VII  List of Contributors
X  Foreword
   Bandello, F. (Milan)
XI  Preface
   Coscas, G. (Créteil/Paris); Loewenstein, A. (Tel Aviv)

1  Evolution of Optical Coherence Tomography Technology Comparison of Commercially Available Instruments
   Pierro, L.; Gagliardi, M. (Milan)

9  Optical Coherence Tomography Pathologic Findings in the Vitreoretinal and Macular Interface
   Goldenberg, D.; Schwartz, R.; Loewenstein, A. (Tel Aviv)

17 Optical Coherence Tomography in the Inner Retinal Layers
   Giraud, J.M. (Toulon); El Chehab, H.; Francoz, M.; Fenolland, J.R.; Delbarre, M.; May, F.; Renard, J.P. (Paris)

26 Optical Coherence Tomography of the Outer Retinal Layers
   Koh, A. (Singapore)

34 Optical Coherence Tomography Findings in the Choroid
   Coscas, G.; Coscas, F. (Créteil/Paris)

46 Pre- and Postsurgical Evaluation of the Retina by Optical Coherence Tomography
   Pellegrini, M.; Bottoni, F.; Cereda, M.G.; Staurenghi, G. (Milan)

54 Optical Coherence Tomography in the Diagnosis of Challenging Macular Disorders
   Querques, G. (Créteil/Milan); Borrelli, E. (Milan); Georges, A.; Souied, E.H. (Créteil)

62 Optical Coherence Tomography in the Management of Diabetic Macular Edema
   Erginay, A.; Massin, P. (Paris)

76 Swept Source Optical Coherence Tomography versus Enhanced Depth Imaging-Spectral Domain Optical Coherence Tomography in Age-Related Macular Degeneration
   Coscas, F.; Coscas, G. (Val de Marne/Paris)

93 ‘En Face’ Optical Coherence Tomography with Enhanced Depth Imaging of Different Patterns of the Choroidal Neovascular Network in Age-Related Macular Degeneration
   Coscas, G.; Coscas, F. (Paris)

101 ‘En Face’ Optical Coherence Tomography Scan Applications in the Inner Retina
   Lumbroso, B.; Rispoli, M. (Rome); Le Rouic, J.F. (Nantes); Savastano, M.C. (Rome)
110 Optical Coherence Tomography Findings in Acute Macular Neuroretinopathy

117 Optical Coherence Tomography in Myopic Choroidal Neovascularization
   Battaglia Parodi, M.; Iacono, P.; Bolognesi, G.; Bandello, F. (Milan)

123 Ganglion Cell Complex and Visual Recovery after Surgical Removal of Idiopathic Epiretinal Membranes
   Pierro, L.; Codenotti, M.; Iuliano, L. (Milan)

127 Choroidal Changes in Patients with Raynaud’s Phenomenon Secondary to a Connective Tissue Disease: Study of Vascular Eye Involvement in Patients Affected by Raynaud’s Phenomenon with in vivo Noninvasive EDI-OCT
   Pierro, L.; Del Turco, C.; Miserocchi, E.; Ingegnoli, F. (Milan)

The innovation of no other diagnostic technique in the field of ophthalmology has had a greater impact on the management of patients than optical coherence tomography (OCT). Clinical activities, diagnostic guidelines, and multicenter trial protocols have been substantially modified by the introduction of OCT in the last 20 years.

The reasons for this success lie in the numerous advantages granted by the use of OCT compared with the other older techniques: simplicity, quickness of execution, noninvasiveness, reliability, repeatability and quantification of measures, and results which are easy to read and understand are only a few of these advantages; these explain well the planetary success obtained in only a few years.

More recently, OCT has also been useful to allow a different interpretation of some retinal diseases, and in the future the contribution of OCT images to the knowledge of pathogenic mechanisms involved in many retinal diseases will certainly be useful.

For some time after its introduction, OCT had only been used in highly specialized centers, but after a while it started to be offered in any outpatient service; the only limitation for its wider distribution was the relatively high costs. Recently, thanks to the availability of several machines on the market, the costs have been reduced, and the number of available instruments is continuing to increase.

Another important factor which contributed to the great success of OCT was the introduction of the intravitreous approach to the therapy of many retinal diseases. OCT is in fact able to detect a very small amount of fluid inside or under the retina, and this helps a lot when deciding whether intravitreous injections are needed or not. The combination of a new diagnostic tool with a new therapy is comparable to what happened in the 1970s and 1980s when fluorescein angiography and laser photocoagulation were introduced into the clinical practice. Also, at that time the interpretation and the therapies of many retinal diseases improved a lot, and for many patients the prognosis changed significantly.

This new volume in the ESASO Course Series is published thanks to the enthusiasm of Professor Gabriel Coscas and Professor Anat Lowenstein who recently chaired an ESASO Course on new developments in the use of OCT and who were able to collect the contributions from all the speakers in a very short period of time.

I hope that you will enjoy reading these contributions as much as they enjoyed working on the project.

Francesco Bandello, Milan
Optical coherence tomography (OCT) is a noninvasive, patient-friendly imaging modality for eye structures. Thanks to recent advances in the technology with its ensuing increasing specificity and sensitivity, OCT has become the modality of choice in visualizing retinal pathologies as well as response to treatment.

The role of OCT has been dramatically enlarging in the last decade, suffice would be to say that it has revolutionized the way we screen, manage and monitor the treatment of retinal disease.

The ESASO intensive course in OCT is a must for any ophthalmologist as well as ophthalmologist in training. After a swift tour of the equipment available and basic techniques, the participants will learn the imaging features of pathological findings in retinal diseases starting with the outer layers including new modalities for choroid imaging, out-layer disease such as various types of macular degeneration, retinal disease such as diabetic retinopathy and vascular occlusion, and retina-vitreous interface pathologies.

Special lectures are dedicated to teaching the practicality of using OCT in pre- and postsurgical evaluation of the posterior segment, in the differential diagnosis of vitreoretinal diseases and in the management of patients with retinal and neuro-ophthalmological diseases.

Pre- and post-treatment cases are presented in a didactical manner. This is followed by a special case presentation elaborating on diagnosis and management.

Gabriel Coscas, Créteil/Paris
Anat Loewenstein, Tel Aviv

Preface
