Foreword
This colloquium differs from those previously held at the Research Institute in Borstel as the producers of new drugs were given the opportunity to introduce their medicaments themselves. We should like to express our sincere thanks to the firms for their willingness to agree with this suggestion—though not without risk. This fact only confirms our conviction that modern industrial research is not basically different from any other kind of serious research. Its high standard allows to take up quickly, though critically the results of industrial research so that the interval is as short as possible between the development of a new product and its clinical evaluation. Like all colloquia in Borstel this one, too, is held on an international basis, jointly organized with the Tuberculosis Research Institute in Prague and especially with its director Dr. KHvinka. As we already stated before internationality of research and international cooperation in this field is independent of political intentions. All over the world humans are confronted with the same problems. in regard to illness and medicine and if they want to achieve results they have to think in the same way and to use the same methods.
