Foreword by Professor Hans Selye VII

General Introduction 1

Part I. Review of related literature

Conditioning governing interactions in the pathogenesis
and prevention of diseases

I. Definitions and terminology, with a historical survey of the modern
literature 12
Historical development of both concepts. Conditioning. Permissive or supportive
actions. Pavlovian use of conditioning. Biologic meaning of adaptation.
Necrotizing cardiopathies.

II. The theory of conditioning and pluricausal diseases

III. Experimental examples of conditioning

IV. Stress as conditioning agent: how do nonspecific adaptive reactions alter susceptibility to disease?
Stress concept. Systemic damage. Systemic defense. Resistance. Conditioning actions of stress: Walker carcinoma; tissue injuries; congenital abnormalities; anaphylactic shock; bacterial infections; scleroderma; gastric erosions; actions of hormones and drugs.

a) Neuroendocrine relationships in adaptive reactions

IV Index of Contents

aldosterone; regulation of trophic, adaptive hormones other than ACTH.

b) Actions of stress and corticoids at the cellular level

V. Conditioning as applied to cardiovascular pathology: stimuli influencing the resistance of the heart muscle
Primary cardiotoxic agents and conditions: plasmocid; papain; cardiac glycosides; potassium deficiency. Secondary (indirectly acting) cardiotoxic agents: sulfonamides; agents influencing the onset of arteriosclerosis. Potential cardiotoxic agents: corticoids, electrolytes and stress—direct effects of
corticoids upon the heart, neural pathways of stress reactions—; nicotine. Miscellaneous agents and conditions: factors that provoke cardiac changes characteristic of rheumatic fever; relationship between pancreas and cardiovascular disease.

VI. Conclusions and outline of problems 112

Part II. Personal investigations

Conditioning factors for cardiac necroses

I. General methodology and glossary 118

II. Sensitization of the heart muscle: positive conditioning actions . . . 125

A. Stress, corticoids and steroids of the vitamin-D group:
   a) Sensitization with Me-Cl-COL for the induction of cardiac lesions by diverse stressor agents 125
   b) Interaction between steroid hormones in the production of the ESCN 135
   c) Conditioning by corticoids for the production of cardiac lesions with noradrenaline 141
   d) Sensitization by DHT for induction of cardiac lesions by various agents 146

B. Electrolytes and electrolyte-steroid interactions:
   a) The role of sodium in stress-induced cardiac necrosis 149
   b) Sensitization by DHT and calcium acetate for the induction of cardiac lesions by various agents 155
   c) Interactions between electrolytes, corticoids and DHT in the production of cardiovascular disease and nephrocalcinosis 160

67. Dietary deficiencies and other sensitizing factors:
   a) Sensitization by K-deficiency for the production of myocardial necrosis by various stressor agents 167

Index of Contents V

b) Sensitization by K- or Mg-deficiency for the production of myocardial necroses by papain 171
   c) Influence of variations in dietary intake of chlorides upon diverse necrotizing cardiopathies 175
   d) Sensitization by chloride deficiency to corticoid-induced cardiac necroses 187
   e) The age factor in the production of various experimental cardiopathies 190
III. Desensitization of the heart muscle: negative conditioning actions

A. Stress, hemodynamic changes and stimuli influencing stress-induced cross-resistance:

a) Adaptation to the cardiac necrosis-eliciting effect of stress 197
b) Induction of cross-resistance to cardiotoxic agents 204
c) Influence of blood pressure upon the production of myocardial necroses by various agents 210
d) Prevention of cross-resistance to cardiotoxic agents by low chloride intake 216

B. Electrolytes:
a) Prevention of stress-induced cardiac necrosis by oral administration of electrolytes 224
b) Prevention by MgCl\(_2\) and KC\(_1\) of the myocardial necroses normally produced by proteolytic enzymes 228
c) Effect of various chlorides upon the development of NaCl\(_4\)-induced cardiac lesions 232

C. Dietary deficiencies and other desensitizing factors:
a) Provocation and prevention of K-deficiency by various ions 234
b) Effect of Na-deficiency upon necrotizing cardiopathies produced by various agents 239
c) Effect of pregnancy upon myocardial lesions produced by various agents 245

IV. Development of new techniques for the induction of experimental cardiovascular disease 250
a) Simple techniques for the surgical occlusion of coronary vessels in the rat and the ECG alterations so induced 250
b) Production of dissecting aneurysms by chronic isoproterenol treatment 271

V. General summary and conclusions 274

VI. References 292

Acknowledgments

It is with great pleasure that I record my gratitude to Professor Dr. Hans Selye—Director of the Institut de Médecine et de Chirurgie expérimentales, Université de Montréal, for his constant advice, guidance, criticism and support given to me throughout the
period of present study and investigation. Some experiments were done in co-authorship with Doctors S. Grasso, Y. Lemire, P. Mendell, M. Nadasdi and S. Renaud, whose valuable cooperation is gratefully acknowledged.

I wish to thank the personnel of the Institut de Médecine et de Chirurgie expérimentales Université de Montréal, for their general helpfulness during my stay in the Institute for the present work. The investigations carried out by me and described in this thesis were made possible through Fellowships received from the Muscular Dystrophy Association of Canada (1957/58) and from the Gustavus and Louise Pfeiffer Research Foundation (1959/61) as well as through grants from The National Medical Research Council of Canada (Consol. Gr. No. 11), The Canadian Arthritis and Rheumatism Society and the National Institutes of Health, U.S. Public Health Service (Grants Nos. A-1641-C2, B-2037-C2 and H-3688C3). I am greatly indebted also to the following firms for their generous supplies of the compounds as indicated:

The Upjohn Company for 6a-methyl-11ß-hydroxyprogesterone, 6a-methyl-11-ketoprogesterone, 6a-methyl-21-fluoro-11ß,17a-dihydroxy-A1,4-pregnadiene-3,20-dione, 6a-methyl-9 a, 21-difluoro-11ß, 17a-dihydroxy-A1,4pregnadiene-3,20-dione, 6a-methyl-21-desoxy-cortisol, 6a-methyl-9a,21-desoxy-cortisol, 6a-methyl-cortisol, 'Medrol', 9-fluoro-cortisol, 2a-methyl-9a-chloro-cortisol;
Lederle Laboratories for 'fluro-16-hydroxy-cortisol, 'Triamcinolone';
The Squibb Institute for 9a-fluoro-16a-hydroxy-16a,17a-acetonide-cortisol;
Schering Corporation for estradiol, 'Progynon', methyl-testosterone, 'Oreton-M' and desoxycorticosterone acetate, 'Cortate';
The Sterling-Winthrop Research Institute for noradrenaline;
Dr. A. Wander, A.G. for dihydrotachysterol, 'Calcamin';
Parke, Davis and Company for vasopressin, 'Pitressin';
Lilly Research Laboratories for plasmocid.
Finally, I would like to thank the Editors and Publishers of the following periodicals:

Acta endocrinologica, American Heart Journal, American Journal of Cardiology, American Journal of Pathology, American Journal of Physiology, Angiology, and Zeitschrift für Vitamin-, Hormon- und Fermentforschung, for granting permission to reproduce some illustrations from my original publications.

Foreword

The concept of conditioning factors for cardiac necroses has received a great impetus through the systematic investigations of Doctor Eörs Bajusz. He has explored this field for many years with considerable assiduity and originality, not only contributing numerous new observations, but also novel and stimulating interpretations of
the observed facts.
The view that certain diseases are dependent upon the simultaneous presence of various factors is not a new one. Many instances of it came to light before we began to speak of “pluricausal diseases”. However, the experimental investigations described in this monograph have contributed a great deal to illustrate the manifold mechanisms through which pluricausal diseases can develop and opened the way to further research, not only on experimental animals, but also in clinical medicine.
The bulk of the work before us was performed in this Institute and formed the basis of the author’s Ph. D. thesis. However, many interesting additional experiments on related subjects were carried out by the author in his new position at the Department of Pathology of our University. These most recent findings are described in the form of an addendum, which brings the reader right up to date regarding the status of our knowledge concerning the role of conditioning factors upon the development of cardiac necroses.
In view of the ever increasing interest both among basic-research men and clinicians in the biochemical mechanism responsible for cardiac necroses, I believe that many readers will welcome the appearance of this carefully documented and stimulating monograph.

Hans Selye
