Preface XIII

Stereotaxic Surgery for Treatment of Parkinson’s Syndrome 1
T. Riechert, Freiburg i. Br.

Clinical Findings 2
General Considerations 2
Major Symptoms 3
Psychological Symptoms 4
Additional Investigations 5
Operative Treatment 8
Stereotaxic Devices 8
The Target Apparatus of Spiegel and Wycis 10
The Stereotaxic Apparatus of Riechert and Wolff (1st Model)
and of Riechert and Mundinger (2nd Model) 11
The Basal Ring 13
The Target Bow 14
The Electrode Holder 15
The Model Ring 17
The Trepanation Marking Ring 17
X-Ray Equipment 18
The Localization of the Target Point and Contrast Filling of the Cerebral
Ventricles 19
Methods of Lesioning 23
Chemical Necrosis 24
Mechanical Lesions 24
Selection of Cases 87
Systemic and Autonomic Symptoms 88
Mental and Psychic Alterations 89
Selection According to the Patient’s Symptoms and Their Duration 89
Selection According to the Topography of the Symptoms 91
Target 91
Microelectrode Recording 93
Monopolar Stimulation 98
Previous Experiences 98
Recent Analysis 99
Results 104
Unilateral Lesions 104

Contents VII

Bilateral Sections 106
Long-Term Results 106
Complications 107
Hemorrhages 107
Mental and Psychic Alterations 108
Epileptiform Seizures 108
Hemiplegia 108
Dysarthria 108
Hemiballism 109
Paraesthesiae 109
Hypotonia and Imbalance 110
References 110

Stereotaxic Operations for Behavior Disorders 113
H. Narabayashi, Tokyo

Introduction 113
The Stereotaxic Approach on Subcortical Frontal White Matter 114
Dorsomedial or Anterior Thalamotomy 116
Surgery on the Limbic System 120
Cingulectomy and Fornicotomy 120
Amygdalotomy 122
Hypothalamotomy 140
Comment 143
Summary of Development of Stereotaxy on the Thalamo-Frontal System 144
Summary of Development of Stereotaxy on the limbic System 145
Amygdaloid and Hippocampal Complex 147
Delineation of the Chosen Target 199
Radiologic Studies of the Target Structure 201
Electrophysiology 203
Introduction 203
Trajectory 204
Technique of Recordings 205
Electrophysiological Characteristics of the Ventral Nuclei 208
Electrophysiological Delineation of the Target 209
Posterior Limit 209
Anterior Limit 214
Laterality 215
Somatotopy of the VP Nucleus 215
Location of Capsular Penetration 216
Conclusion 218
References 219

Surgery for Epilepsy 222
D. Jinn ai and J. Mukawa, Osaka

Introduction 224
History of Surgical Treatment for Epilepsy 224
Surgical Treatment in Modern Times 225

Contents IX

Indirect Approaches 225
Procedures Based on Endocrinological Hypotheses 225
Peripheral Surgery 226
Surgery Based on the Auto-Intoxicating Theory 226
Vascular Procedures 226
Direct Approaches 227
Cortical Excision 227
Ablation of Area 6 of Brodmann 227
Temporal Lobectomy 228
Hemispherectomy 228
Undercutting or Leucotomy (Lobotomy) 229
Drainage and Ventriculostomy 229
Cranioplasty 229
Durai Graft 230
Pneumoencephalography 230
Stereotaxic Surgery 230
Local Cortical Hypothermia and Application of GABA and
its Derivatives 230
Surgery for Epileptogenic Expanding Lesions 231
Incidence 231
Incidence According to Location in the Brain 232
Infratentorial Tumors 232
Supratentorial Tumors 232
Seizure Incidence According to the Nature of the Lesion 232
Gliomas 232
Meningiomas 233
Subdural Hematomas 233
Brain Abscess 233
Results of Extirpation 234
Meningiomas (Meningeal Fibroblastoma) 234
Astrocytomas 234
Glioblastoma multiforme 235
Brain Abscess 235
Discussion 236
Focal Cortical Excision 237
Technique of Excision of Epileptogenic Foci 237
Preparation of the Patient 238
Analgesia and Anesthesia 238
Craniotomy 238
Electrical Stimulation 238
Electrocorticography 239
Cortical Excision 239
Indispensable Cortex 240
Postoperative Care 240
Results of Cortical Excision 241
Discussion 246

Contents X

Temporal Lobectomy 247
Introduction 247
Indications 248
Selection of the Surgical Procedures 249
Technique of Temporal Lobectomy 250
Discussion Concerning the Necessity of Additional Insulectomy 254
Pathology 255
Results 258
Complications 260
Discussion 262
Stereotaxic Surgery for Epilepsy 262
Introduction 262
Stereotaxic Surgery for Neocortical Seizures 263
Subcorticogenic Seizures 263
Pallidoansotomy and Pallidoamygdalotomy 263
 Interruption of Preferential Pathways for Convulsive Impulses 265
Lenticulotomy 266
Putamectomy 267
Forel-H-Tomy 267
Stereotaxic Surgery for Temporal Lobe Epilepsy 271
Fornicotomy 272
Upper Mesencephalic Reticulotomy 272
Hypothalamotomy 273
Amygdalotomy 273
Dorsomedial Thalamotomy 274
Other Approaches 275
Discussion 275
Discussion and Conclusions 277
References 280

Stereotaxic Approach to Epilepsy. Methodology of
Anatomo-Functional Stereotaxic Investigations 297
J. Talairach and J. Bancaud, Paris

General Methodology 298
Procedure for Preoperative Investigation 298
Procedure for Standard Electrocorticographic Investigation 299
Methods of Stereotaxic Investigation 303
Principles of Anatomic Stereotaxic Investigation 306
Essential Conditions for Investigation 306
Principles of Stereotaxic Localization 306
Direct Stereotaxic Localization of Cerebral Structures 310
Indirect Stereotaxic Localization of Cerebral Structures 314
Application of Stereotaxic Localization Procedures to the Implantation
of Intracranial Electrodes 321

Contents XI

Principles of Functional Stereotaxic Investigations (SEEG) 330
Choice of Structures to Be Investigated 331
Acute and Chronic Investigations 332
The SEEG Investigation 332
Introduction 355
Surgery for Parkinson's Disease 357
Localization of Stereotaxic Targets 358
Electrical Stimulation of the Target and Surrounding Structures 361
Motor Responses to Electrical Stimulation of the Thalamus and Adjacent Structures 361
Subjective Sensory Responses to Electrical Stimulation of Nucleus VPL and VPM 365
Evoked Cortical Potentials from Thalamic Stimulation 368
Depth Electroencephalography (SEEG) and Routine EEG during Stereotaxic Procedures 372
Recording of Thalamic Unit Activity with Microelectrode Techniques 372
Modifications of Spontaneous Tremor 373
Other Tests for Target Localization 378
References 380

The Place of L-Dopa in the Treatment of Parkinson's Disease 387
J. Siegfried, Zürich

History of Classic Medical and Surgical Treatment 387
History of L-Dopa Therapy 389
The delay in appearance of this 5th volume is a source of chagrin to the editors. Most of the authors of the chapters herein submitted their manuscripts many months ago; Drs. Krayenbühl, Maspes and Sweet tender their humble apologies to the punctual essayists. Fortunately the sections on neurosurgical treatment of involuntary movements and of epilepsy were written at a time at which the subject had reached a relative plateau from which it has not moved in a major way. Although there are many rapidly changing areas in neurosurgery where knowledge is explosively expanding our diagnostic and therapeutic horizons, this group of chapters is not obsolescent by the time the reader will receive it. This volume presents in one convenient place a comprehensive exposition and summary of the advantages and risks attendant upon the procedures worked out by each of the several active schools of stereotactic neurosurgery in the fields under discussion. We are thankful to the major exponents of each school for their willingness to undertake the arduous collation and evaluation of their efforts over the past quarter century. The product should enable the neurosurgeon to pick and choose from each school’s techniques and knowledge those features most convincing to him. We know of no comparable presentation. It is noteworthy that 7 nations are represented in the 9 chapters in the volume, and that the 2 nations each providing two chapters are France and Japan. Indeed when we recognize that the Canadian group of Bertrand...
and colleagues speak French as their primary language we become even more aware of the evidence of the eminence of the French culture in stereotactic techniques vis-à-vis the brain. If there was ever a monopoly on innovation and superior performance in neurosurgery among those

Editorial Preface XIV

whose native tongue is English, such a degree of dominance of that or any other national grouping is gone. There never was anything to prevent literally anyone from having a good idea. It is now apparent that favorable conditions are present in many cultures to permit such ideas from coming to fruition. It is equally apparent that no one can stay abreast of the field of neurosurgery if he does not keep himself cognizant of ‘what’s new’ from many quarters of the globe. It remains an objective of ‘Progress in Neurological Surgery’ to facilitate this global recognition of merit in our field.
