Foreword

This Symposium was organized to get an overview of the current state of knowledge in a highly specialized area of reproductive biology which has a direct bearing on the present-day problem of population overgrowth. The other main purpose of this international meeting was to identify promising new leads for the development of a new generation of contraceptives which would be as effective as the oral contraceptives but without their side-effects. Both these aspects are dealt with in the papers prepared by some of the eminent investigators from different parts of the world.

This meeting was organized as part of the activities of the World Health Organization Research and Training Centre in Human Reproduction at the All-India Institute of Medical Sciences during the World Population Year 1974. The financial support of the Family Planning Foundation of India, The Ford Foundation, the WHO and organizational support given by the Government of India, the Indian Institute of Advanced Study, where the meeting was held, and the International Neuroendocrine Society are gratefully acknowledged.

T.C. Anand Kumar
