Foreword

Septicemia is not only a complication of bacterial and viral infections, but a condition determined by both internal and external environmental factors.

The 1st International Symposium on Present Diagnosis and Treatment of Septicemia was held with the purpose of studying the different factors causing septicemia, its diversity and the means of preventing it. This work was fruitful enough, since it has produced new aspects to be studied in this field. The main conclusion would be, therefore, that more efforts have to continue in the field of septicemia. These Proceedings are a contribution to this idea.

The Editors, Prof. GARROD, Prof. JAWETZ, Prof. SENECA and Dr. FERERES have done a wonderful job, putting in order most of the excellent material presented to the Symposium.

Both participants and editors have contributed, in a very important way, to the progress of the medical sciences.

PEDRO DOMINGO
President of the Symposium
