45 Proteases in Helminth- and Allergen-Induced Inflammatory Responses
S. Donnelly, J.P. Dalton, Sydney; A. Loukas, Brisbane

45 Abstract
48 Proteases Are Major Allergens Derived from Various Organisms
49 How Do Proteases Act as Allergens?
49 Disruption of the Epithelial Barrier
50 Modulation of Dendritic Cell (DC) Function
50 Modulation of B and T Cell Function
50 Activation of Mast Cells Via Protease Activated Receptors
51 Alteration of the Protease/Anti-Protease Balance
52 Proteases Provoke Allergenic Responses to Non-Peptidolytic Molecules
53 Do Parasites Exacerbate or Protect against Allergy?
54 Helminth Parasites Secrete Proteases
54 Can Parasite Proteases Sensitise Individuals to Environmental Proteases Via Cross-Reactive IgE?
57 Parasite Peptidolytic Activity May Sensitise Individuals to Allergens
57 Degranulation of Mast Cells and Basophils
57 Modulation of T Cell Responses
58 Recruitment and Activation of Alternatively Activated Macrophages
58 Are Helminth Proteases Allergens?
61 Conclusion
62 Acknowledgements

91 Glycans Modulate Immune Responses in Helminth Infections and Allergy
I. van Die, Amsterdam; R.D. Cummings, Oklahoma City, Okla.

Abstract
Glycan Ags in Schistosomes
Schistosome Glycan Ags Generate High Levels of Anti-Glycan Abs in Infection
Helminth- and Allergen-Derived Glycan Ags Induce Th2 Responses
Immunogenic Glycan Ags Shared between Helminths and Allergens Are IgE Epitopes
Glycan Ags Regulate Immune Responses via Interaction with Host Lectins
C-Type Lectins on Antigen-Presenting Cells Recognize Glycan Ags
Recognition of Schistosome- or Allergen-Derived Glycan Ags by Antigen-Presenting Cells
Schistosome Egg Glycan Ags Interact with DC-SIGN
L-SIGN Binds Schistosome Egg Glycan Ags
Interaction of Schistosome Glycan Ags with hMGL
The Mannose Receptor Recognizes Ags from Schistosome Eggs and House Dust Mite Der p 1
Host Protection Mechanisms May Include the Binding of Glycosylated Ags by Soluble Lectins in Schistosomiasis and Allergy
Interaction of Helminth Glycan Ags and Allergens with Collectins
Galectin-3 Recognizes LDN Glycan Ags within Schistosome SEA
Does IL-10 Production Induced by Parasite Glycans Contribute to Protection Against Allergy?
Concluding Remarks

148 Cytokine Release
148 Immunomodulatory Properties of Histamine
149 Basophils and the Immune Response to Helminth Infections
One of the key words of immunology at the beginning of the 21st century is ‘regulation’. Twenty-five years later the Th1/Th2 paradigm, the concept of regulatory cell populations, is now in the heart of our understanding of immune response.

Helminths and allergic conditions are recognized as the main Th2 cell inducers. The negative association of allergic manifestations and helminth infections has been debated for over 30 years. It is, however, only in the recent past, that modulation of allergy by helminth infections has been clearly substantiated and shown to be consistent with the activity of regulatory cell populations, which control effector mechanisms of both Th1 and Th2 types.

Although remarkable progress has been made in identifying the molecular events required for Th2 differentiation, a number of questions which are addressed in this volume point to essential challenges.

Several contributions illustrate the critical importance of characterization of helminth molecules with Th2 or regulatory inducing activities and their modes of action in dendritic cells.

The large emphasis given to glycan epitopes highlights the profound immunomodulatory properties of glycan antigens and their role in inducing two key regulatory cytokines IL-10 and TGF-β. It is striking that the specificity of helminth infection does not influence the profile of the regulatory response: Schistosomes, Onchocerca, Wuchereria or gut nematodes for instance, induce similar patterns of cytokine production, the regulation appearing more related to the chronicity of infections than to the pathogen itself.
Although the identification of regulatory cell populations has progressed, we are left with a global notion of heterogeneity and a rather unclear respective role of the various incriminated populations: regulatory T and B cells, natural killer T cells, mast cells and basophils, etc. The concept that primary and secondary regulatory populations may account for their heterogeneity is very stimulating, and the role of Fox p 3 as a master control gene is very attractive.

Whereas most of the contributions discuss the down-modulation of allergy by helminths, there is also some evidence that allergy or predisposition to atopic diseases may protect against helminth infections. It is, on the other hand, of particular interest that removal or inhibition of regulatory T cells leads to the effective clearance of infection and restoration of antigen specific activity.

In practical terms, one may expect that allergen-specific immunotherapy, which generates populations of allergen-specific regulatory T cells, producing IL-10 and TGF-β, can significantly reduce allergic manifestations. Conversely, successful immunization against helminth infections and the development of efficient vaccines will certainly rely on a subtle balance between the induction of appropriate effector mechanisms and the expression of regulatory responses.

In this context, the various contributions to this volume dedicated to Parasites and Allergy reveal a new dimension of host-parasite interactions and of the importance of anti-inflammatory responses in chronic helminthiasis. They also provide a novel insight on the possible modes of down-modulation of unwarranted immune responses. They finally pave the way to new directions of research for the successful immunization against helminths and the prevention of inflammatory responses in allergic and autoimmune diseases.

André and Monique Capron, Lille
