Telemedicine and remote patient monitoring are innovative tools to provide remote transmission, interpretation, and storage of data for review by the care team. These tools allow for accurate home monitoring of patients enabling the team to improve care through prevention and early identification of problems.

This book describes the evolution of peritoneal dialysis and related technology. It summarizes current unmet clinical needs reported by patients and care teams, the need for innovation in the field, and the technical and clinical issues involved with the modern management of peritoneal dialysis. Furthermore, the operational characteristics of the new information communication technology system and, in detail, the features of the Sharesource platform are presented. Finally, a series of field experiences by expert users are reported to describe the benefits and the potential applications of remote patient monitoring in the future.

Telemedicine and remote patient monitoring have proven to be useful in the care of patients on peritoneal dialysis. The scope of this publication, therefore, is to present the experiences of clinical key opinion leaders who have been using the application.
Dear Librarian,

I have reviewed Remote Patient Management in Peritoneal Dialysis and would like to recommend it for your library.
